Address Change

Our mailing address is changing to **PO Box 635, Harrison, AR 72602-0635**. Please update your records, and if you are using bill-pay or some other payment service instead of our return envelope, please make appropriate changes with your bank so that your check will be sent to the right place. Thank you!

Stellar Updates

Some recent enhancements and updates to Stellar (go to the Help menu in Stellar and click Download Stellar Update to open our webpage with the complete list):

Various Programs

Searching most lists is no longer case-sensitive.

Patients

Added a pop-up-only 500 character extended message field.

Added a preferred phone number option.

Colored Transaction History lines to make it easier to visually identify credits, debits and status note records.

Double-clicking an IN (insurance note) record in the history will now jump to the referenced date.

Patients, Zipcodes

City and state are now stored directly in the patient file, instead of a user-managed list keyed by zipcode.

Zipcode lookup now uses a country-wide master list by default to assist in auto-filling the city and state fields. Optionally, the old user-maintained zipcode list can

be used instead.

Multi-Column Appointments

Added ability to edit notes by double-clicking an appointment.

Added option (in Configuration) to pop-up messages when an appointment is selected.

Appointment Listing

Can now print in a multi-column format to match the multi-column scheduler. Columns greater than 4 will print on additional pages.

Find Waiting/Pending Report

Added option to order by patient name.

Pre-Insurance Report

Added option to only list patients with errors.

Daily Summary

Now lists both missed and cancelled appointments when Mark Missed Appointments is checked.

Luc Montagnier, Nobel Prize Winner, Takes Homeopathy Seriously

From HuffingtonPost.com, By Dana Ullman

Dr. Luc Montagnier, the French virologist who won the Nobel Prize in 2008 for discovering the AIDS virus, has surprised the scientific community with his strong support for homeopathic medicine.

In a remarkable interview published in Science magazine of December 24, 2010, Professor Luc Montagnier, has expressed support for the often maligned and misunderstood medical specialty

of homeopathic medicine. Although homeopathy has persisted for 200+ years throughout the world and has been the leading alternative treatment method used by physicians in Europe, most conventional physicians and scientists have expressed skepticism about its efficacy due to the extremely small doses of medicines used.

Most clinical research conducted on homeopathic medicines that has been published in peer-review journals have shown positive clinical results, especially in the treatment of respiratory allergies, influenza, fibromyalgia, rheumatoid arthritis, childhood diarrhea, post-surgical abdominal surgery recovery, attention deficit disorder, and reduction in the side effects of conventional cancer treatments. In addition to clinical trials, several hundred basic science studies have confirmed the biological activity of homeopathic medicines. One type of basic science trials, called in vitro studies, found 67 experiments (1/3 of them replications) and nearly 3/4 of all replications were positive.

In addition to the wide variety of basic science evidence and clinical research, further evidence for homeopathy resides in the fact that they gained widespread popularity in the U.S. and Europe during the 19th century due to the impressive results people experienced in the treatment of epidemics that raged during that time, including cholera, typhoid, yellow fever, scarlet fever, and influenza.

Montagnier, who is also founder and president of the World Foundation for AIDS Research and Prevention, asserted, "I can't say that homeopathy is right in everything. What I can say now is that the high dilutions (used in homeopathy) are right. High dilutions of something are not nothing. They are water structures which mimic the original molecules."

Here, Montagnier is making reference to his experimental research that confirms one of the controversial features of homeopathic medicine that uses doses of substances that undergo sequential dilution with vigorous shaking in-between each dilution. Although it is common for modern-day scientists to assume that none of the original molecules remain in solution, Montagnier's research (and other of many of his colleagues) has verified that electromagnetic signals of the original medicine remains in the water and has dramatic biological effects.

8000 IUs of vitamin D daily necessary to raise blood levels of "miracle" anti-cancer nutrient, declares groundbreaking new research

From NaturalNews.com, by Mike Adams

(NaturalNews) The reign of censorship and suppression against vitamin D is now coming to an end. Even though the Institute of Medicine (IOM) and many institutions leading the cancer industry (including the ACS) have intentionally tried to downplay the ability of vitamin D to prevent cancer, a new study appearing in the journal *Anticancer Research* lays out the simple, powerful truth about vitamin D that we've been teaching at NaturalNews for years: A typical adult needs 4,000 - 8,000 IUs of vitamin D each day to prevent cancer, MS and type-1 diabetes, not the ridiculously low 400 - 800 IUs recommended by the U.S. government.

The new research was conducted by scientists at the University of California, San Diego School of Medicine and Creighton University School of Medicine in Omaha. It is groundbreaking research because it establishes the relationship between vitamin D dosage and circulating vitamin D levels in the blood.

This is a first. It is crucial information for the health care revolution that will be necessary to save states and nations from total health care bankruptcy in the coming years. Vitamin D turns out to be one of the simplest, safest and most affordable ways to prevent degenerative disease and sharply reduce long-term health care costs.

Up to 8,000 IUs needed daily

"We found that daily intakes of vitamin D by adults in the range of 4,000 to 8,000 IU [international units] are needed to maintain blood levels of vitamin D metabolites in the range needed to reduce by about half the risk of several diseases -- breast cancer, colon cancer, multiple sclerosis and type 1 diabetes," said Dr. Cedric Garland.

Dr. Garland is the professor of family and preventive medicine at the UC San Diego Moores Cancer Center. He went on to say:

"I was surprised to find that the intakes required to maintain vitamin D status for disease prevention were so high -- much higher than the minimal intake of vitamin D of 400 IU/day that was needed to defeat rickets in the 20th century."
